Circular-economy effects on European production: separate steel routes

EU-only CE in 2050 | change from each model's own 2050 no-CE case

Reference: each model's own 2050 no-CE output in the same pathway and production category (0%).

Primary and secondary steel each use their own route reference. These percentage changes are not additive.

NDC+LTT secondary steel: OMNIA no-CE inputs are missing; its percentage response is undefined.

Cement and aluminium retain Figure 1's total-output definitions. GCAM aluminium route coverage remains unconfirmed.

All eight panels share one percentage scale. Labels rounded to 0.1%; EU-region boundaries differ slightly.

OMNIA missing additive activity = zero (provisional); GCAM missing values remain gaps.
