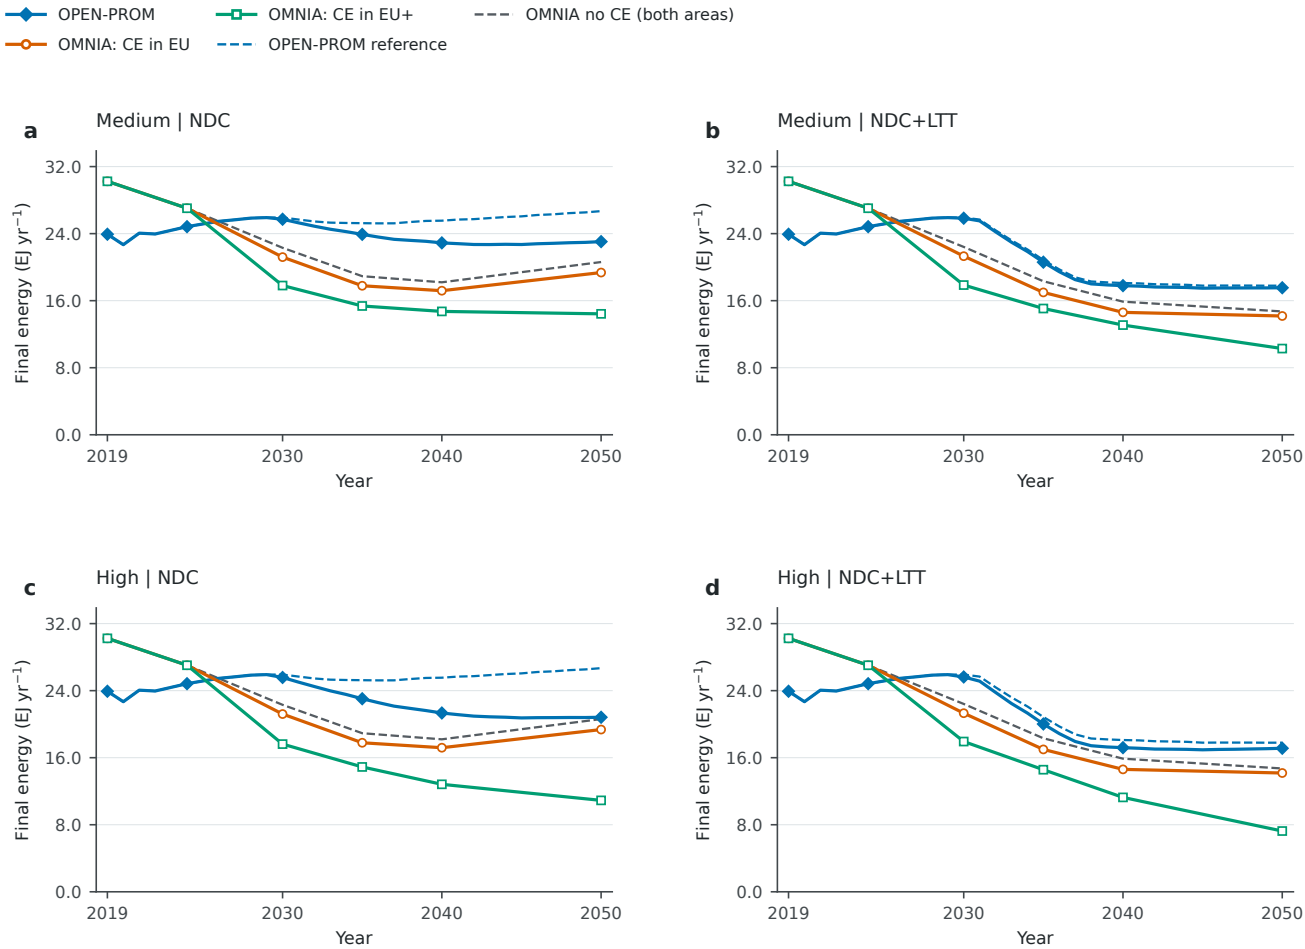
Global steel final energy | absolute levels

Source observations, 2019–2050 | dashed lines show the matching references

Final energy: OPEN-PROM Mtoe converted to EJ; OMNIA sums five exact carrier parents.



All values are global. EU/EU+ identify OMNIA's CE adoption area; EU+ = EU plus partners (17 regions).

OPEN-PROM medium/high policy content and adoption geography are undocumented; labels are paired descriptively.

Different historical levels are retained; no calibration or production-scope adjustment is imposed.

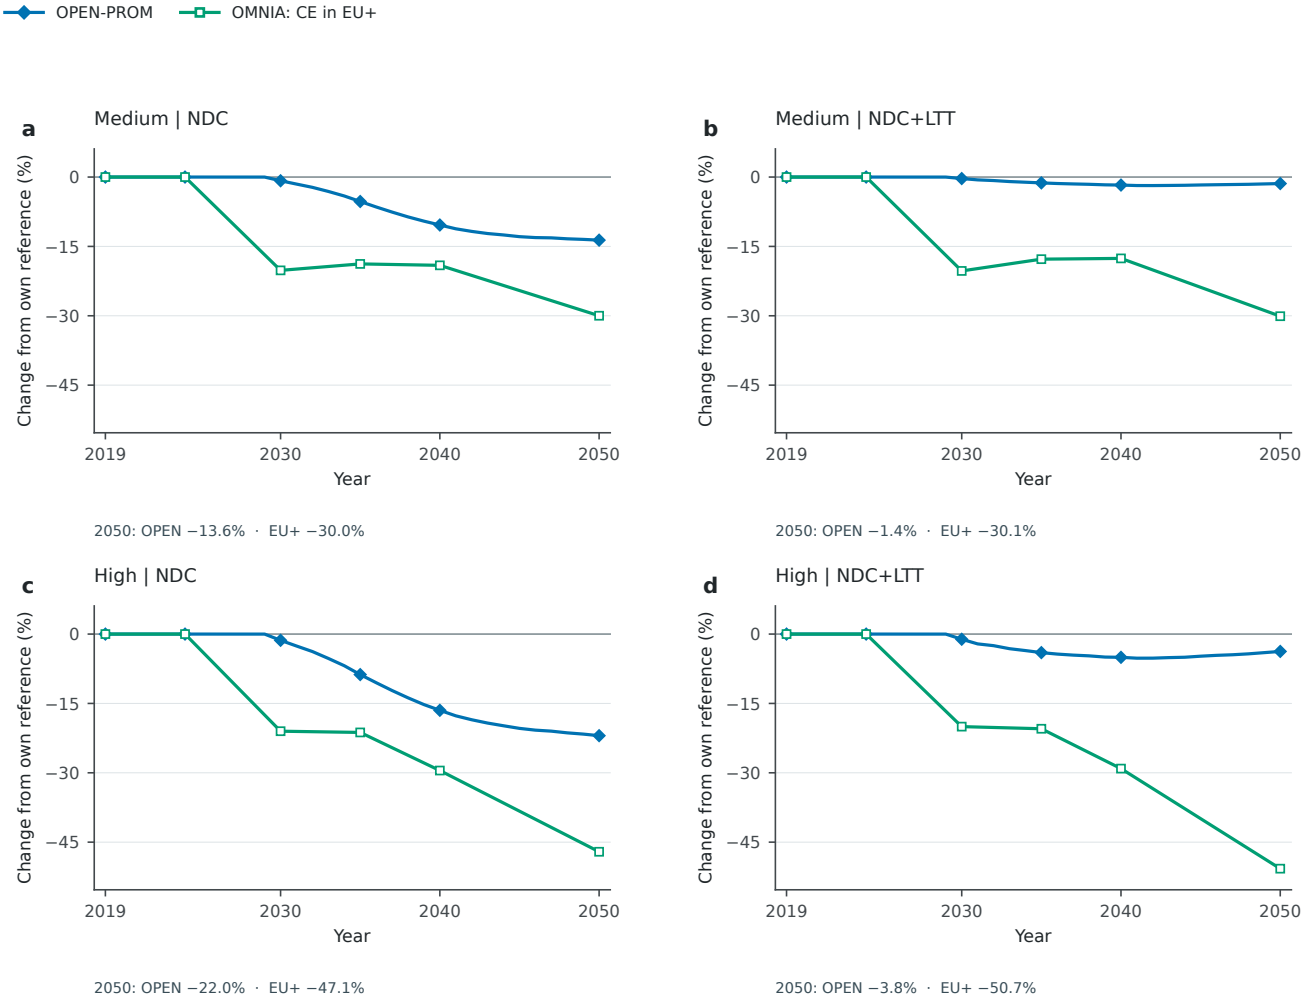
OMNIA missing activity = zero (provisional); OPEN-PROM uses complete reported World totals.

OPEN-PROM retains annual observations; OMNIA markers show supplied years. Lines connect observations without smoothing.

Global steel final energy | response to medium/high settings

Change from each model's own reference in the same pathway and year

Final energy: OPEN-PROM Mtoe converted to EJ; OMNIA sums five exact carrier parents.



All values are global. OMNIA EU+ = CE in EU plus partners (17 regions).

OPEN-PROM medium/high policy content and adoption geography are undocumented; labels are paired descriptively.

Different historical levels are retained; no calibration or production-scope adjustment is imposed.

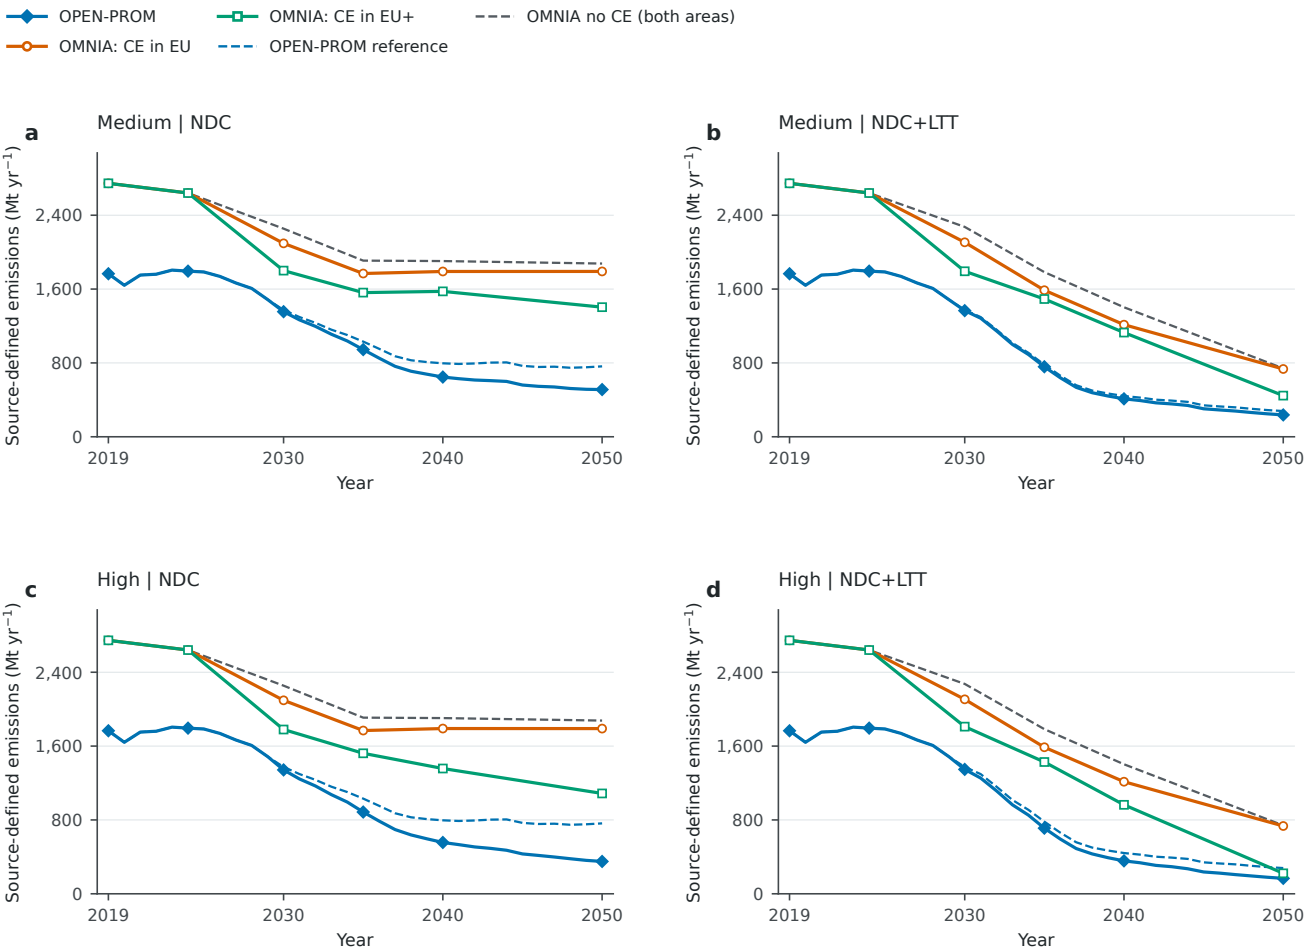
OMNIA missing activity = zero (provisional); OPEN-PROM uses complete reported World totals.

OPEN-PROM retains annual observations; OMNIA markers show supplied years. Lines connect observations without smoothing.

Global steel: source-defined emissions | absolute levels

Source observations, 2019–2050 | dashed lines show the matching references

OMNIA = reported steel GHG (Mt CO_2e/yr); OPEN-PROM = energy-related CO_2 (Mt CO_2/yr).



All values are global. EU/EU+ identify OMNIA's CE adoption area; EU+ = EU plus partners (17 regions).

OPEN-PROM medium/high policy content and adoption geography are undocumented; labels are paired descriptively.

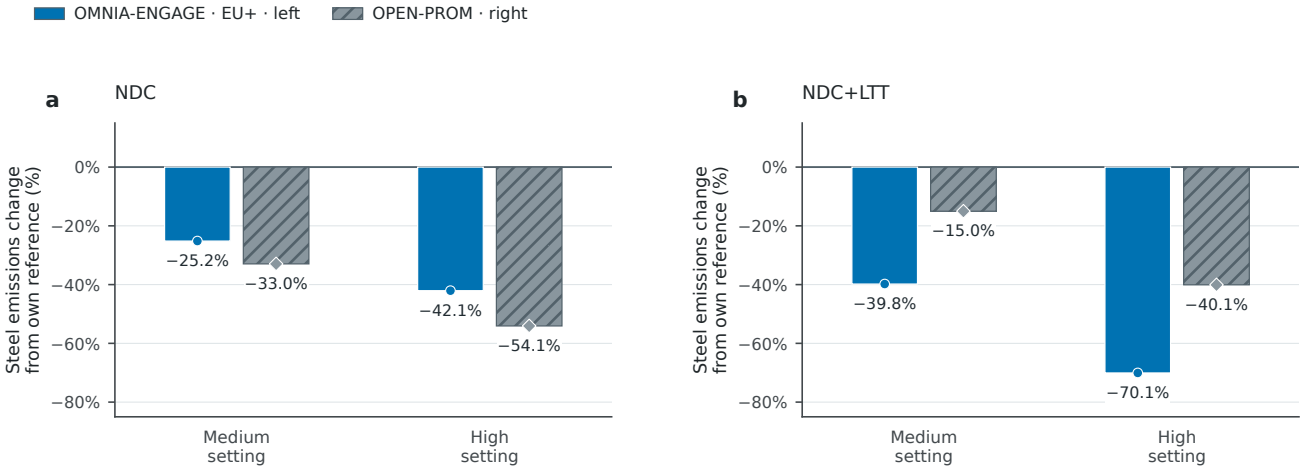
CO_2/GHG and process-accounting boundaries differ. Percentages do not harmonise the emissions scopes.

OMNIA missing activity = zero (provisional); OPEN-PROM uses complete reported World totals.

OPEN-PROM retains annual observations; OMNIA markers show supplied years. Lines connect observations without smoothing.

Global steel emissions: response to medium/high settings

2050 | OMNIA CE in EU+ | change from each model's own pathway reference



OMNIA: reported steel GHG; OPEN-PROM: energy-related steel CO_2. Gas/process boundaries differ.

Each model uses its own 2050 pathway reference; capture is not subtracted again.

OMNIA CE in EU+ (17 regions); OPEN-PROM intervention and adoption geography are undocumented.

OMNIA missing activity = zero (provisional). Medium/high labels do not establish equivalent policies.
